Abstract. Maintaining student enthusiasm and engagement in the rapidly growing sector of online English language instruction presents constant problems. This study examines how learners' motivation, engagement, and language development in virtual learning environments are impacted by formative assessment tools, particularly analytical rubrics, peer review, and teacher feedback. The study explores how ongoing, criterion-based feedback promotes self-regulated learning and fosters positive attitudes towards studying English. It is based on sociocultural and constructivist learning theories. Surveys, reflective journals, and online classroom observations were used to collect data from B1–B2 level students enrolled in an online ESL program. According to research, formative assessment greatly increases student engagement, encourages intrinsic motivation, and improves teacher-student communication when applied regularly and openly. The paper concludes with recommendations for integrating formative assessment tools to promote engagement, reflection, and sustained learning in digital TESOL contexts.

1. Introduction. The way that professors and students engage has changed as online education has taken over as the primary method of teaching languages. Particularly since the global pandemic, studying English has been increasingly prevalent in virtual environments. Digital learning systems present issues with student motivation, engagement, and communication even while they provide flexibility and accessibility. In online settings that might not provide instant

feedback or in-person connection, teachers frequently find it difficult to maintain students' engagement and reflection.

The effectiveness of formative evaluation as a teaching strategy to address these issues is becoming more widely acknowledged. Formative assessment offers ongoing, helpful feedback during the learning process, in contrast to summative assessment, which evaluates results at the conclusion of training. With the use of this feedback, students can pinpoint their areas of strength, pinpoint areas for growth, and take proactive measures to meet learning objectives. With the help of this feedback, students can pinpoint their areas of strength, pinpoint areas in need of development, and actively work towards their learning objectives.

Formative evaluation techniques like teacher feedback, peer review, and analytical rubrics can give students in online English courses valuable chances to think critically and participate. This study investigates how these technologies affect student engagement and motivation as well as how they support the growth of learner autonomy in digital environments.

2. Literature Review

2.1 The Concept of Formative Assessment

According to Black and Wiliam (2018), formative assessment is evaluation for learning as opposed to evaluation of learning. It entails a continuous process of obtaining data regarding student development and applying it to guide instruction. Education research continuously shows that regular, focused feedback has a significant impact on student progress (Hattie & Timperley, 2007; Brookhart, 2018).

By assisting students in becoming conscious of their language growth, communicative proficiency, and learning techniques, formative assessment in TESOL promotes language development. Students are more likely to remain motivated and involved when they are given clear feedback and understand the requirements for success.

2.2 Motivation and Engagement in Online Learning

In language learning, motivation and engagement are tightly related. While engagement shows the behavioural and emotional commitment students make, motivation supplies the energy for learning. Deci and Ryan's (2000) Self-Determination Theory states that when learners' demands for autonomy, competence, and relatedness are satisfied, they become more motivated.

These demands can be supported or impeded by online learning settings. Students may become disengaged from instruction if there is no personal connection or feedback. However, by offering interactive feedback, social participation through peer collaboration, and visible progress, well-structured formative assessment systems can maintain motivation (Martin & Bolliger, 2018).

2.3 Analytic Rubrics as Motivational Tools

Analytical rubrics assist students in visualising the quality standards for every activity and make performance expectations clear. Rubrics can be integrated into online English learning platforms such as Edmodo or Google Classroom, enabling students to evaluate their own work prior to turning in assignments. By providing students with precise instructions on how to get better, rubrics improve self-regulated learning and boost motivation, according to research by Panadero and Jonsson (2020).

2.4 Peer and Teacher Feedback

While instructor feedback offers professional advice and emotional support, peer feedback promotes teamwork. According to Li and De Luca (2014), combining the two types of feedback results in a rich formative environment that inspires students. Online resources that enable prompt, tailored feedback that improves student engagement include Padlet, Zoom chat, and shared Google Docs.

Although most research suggests that formative evaluation increases motivation and engagement, there is little empirical data from TESOL situations in Central Asia, where online learning is still growing quickly. This research helps close that gap.

3. Methodology

3.1 Research Design

To investigate the connection between formative assessment tools and student motivation in online English learning, the study uses a mixed-methods approach. While students' lived experiences are captured by qualitative data, motivation trends are measured by quantitative statistics.

3.2 Participants

In this study, thirty students of the B1–B2 level took part. They were all registered for an eight-week online course in English that was taught via Zoom and Google Classroom. The participants represented a variety of linguistic origins (Kazakh, Russian, and Uzbek) and ranged in age from 17 to 22.

3.3 Instruments

1. **Pre- and Post-Course Surveys** measured learners' motivation and engagement using Likert-scale questions.
2. **Reflective Journals** were collected weekly to understand learners' feelings about feedback and assessment.
3. **Classroom Observations** of recorded lessons were analyzed to document participation rates and types of feedback interaction.

3.4 Data Analysis

Descriptive statistics were used to examine survey quantitative data in order to track shifts in motivation levels. Thematic coding of qualitative data from observations and journals revealed important themes like self-reflection, emotional reactions, and the efficacy of feedback.

4. Findings and Discussion

4.1 Increased Motivation through Clear Criteria

Analytical rubrics, according to students, made learning objectives clear and attainable. Rubrics "made it easier to see progress" and "motivated them to reach higher levels," according to the majority of participants. This backs up Deci and Ryan's theory that one of the main motivators, competence, is increased by having clear expectations.

4.2 Engagement through Continuous Feedback

The most beneficial aspects of online learning were consistently recognised as being peer and teacher feedback. Students said that getting quick feedback "kept me involved" and "made lessons feel alive." Student participation was higher in classes that used regular formative feedback, according to observation data. Feedback helped to close the emotional gap between students and teachers in online learning.

4.3 Peer Review and Social Motivation

Peer evaluation was valued by students because it brought interaction to the learning process. Peer evaluation gave students the chance to observe other writing and speaking styles in addition to assisting them in reflecting on their own work. This is consistent with the social constructivist theory of Vygotsky (1978), which places an emphasis on learning via group work and collective meaning-making.

4.4 Challenges Identified

Notwithstanding the favourable results, certain difficulties surfaced. Some children were hesitant to share their preferred teacher rating and peer input.

Sometimes interaction was hampered by technical problems, such as erratic internet connections. Instructors also mentioned how time-consuming it was to prepare thorough feedback online.

4.5 Discussion

These findings support the body of research indicating that formative evaluation increases student involvement and motivation (Black & Wiliam, 2018; Brookhart, 2018). The cultural significance of teacher authority in Central Asian contexts is a TESOL-specific component that this study contributes. Trust and autonomy are ensured by striking a balance between teacher-led direction and peer evaluation.

5. Pedagogical Implications

1. **Use Transparent Rubrics:** Share analytic rubrics with learners before tasks to clarify expectations and support goal setting.
2. **Encourage Feedback Cycles:** Provide structured opportunities for revision after feedback to reinforce progress.
3. **Integrate Peer Review:** Design peer activities that are guided and supported to foster collaboration.
4. **Leverage Technology:** Utilize online tools that simplify real-time feedback (e.g., comments on Google Docs, recorded voice notes).
5. **Support Teacher Training:** Professional development should address digital feedback strategies and time management in online settings.

6. Conclusion

Formative assessment is a process that changes learning, not just a way to gauge progress. Rubrics, peer reviews, and teacher assistance are examples of formative techniques used in online English instruction that foster an environment where students actively participate in their own growth. According to the study's findings, students' motivation, engagement, and self-confidence are greatly increased by regular, clear feedback.

Using formative assessment techniques in online settings can help TESOL teachers create more engaging, interactive, and learner-centred virtual classrooms. By examining the long-term impacts of formative assessment on academic performance and emotional resilience in digital language acquisition, future research may build on this work.
